Hybrid energy storage system (HESS) generally comprises of two different energy sources combined with power electronic converters. This article uses a battery super-capacitor based HESS with an adaptive tracking control strategy. The proposed control strategy is to preserve battery life, while operating at transient conditions of the load.

In a power backup or holdup system, the energy storage medium can make up a significant percentage of the total bill of materials (BOM) cost, and often occupies the most volume. The key to optimizing a solution is a careful selection of components so that holdup times are met, but the system is not overdesigned.

With a capacitance of 85.8 mF cm^{-3} and an energy density of 11.9 mWh cm^{-3} , this research has demonstrated the multifunctionality of energy storage systems.
