What is a dc microgrid?

DC microgrids (DCMGs) presents an effective means for the integration of renewable-based distributed generations (DGs) to the utility network. DCMGs have clear benefits such as high efficiency, high reliability, better compatibility with DC sources and loads, and simpler control, over its AC equivalent system.

Can a dc microgrid network simulate a pole to ground fault?

Furthermore, a transient simulation for pole to ground faults in a DC microgrid network is performed with different earthing methods in order to investigate fault behaviour. The paper is organised as follows. Section 2 presents the different DC microgrid configurations.

What is the importance of grounding in DC-distribution network?

The importance of grounding in the DC-distribution network with its types is also discussed in a deep sense. Furthermore, the protection systems implemented for AC microgrid, high voltage DC-transmission, DC microgrid are also compared, and it is impartial to declare that protection of DCMGs is still regarded as an open issue for future studies.

Why is a dc microgrid a multi-terminal protection system?

The topology of the DC microgrid is thus multi-terminal. And hence it becomes tricky to design a protection system flexible enough to deal with multiple numbers of terminals under a multi-directional power flow condition.

Can a DC BUS be grounded if a grid is solidly grounded?

In a network with solidly grounded AC grid, solid grounding of the non-isolated DC bus creates a permanent fault. Hence, AC grid network with solidly grounded neutral, preclude the possibility of solid grounding of the DC bus, unless the network is electrically isolated using an isolation transformer, as in Fig. 8 (a).

What is radial configuration in a dc microgrid?

When a fault occurs in the DC bus, the IED first detects and isolates the faulty bus from the network and then the load power turns to be supplied through an alternative healthy path. For the purpose of this study and due to its simplicity, a radial configuration has been used in the test DC microgrid model.
