

Winter Solstice Solar Power Generation

When is the winter solstice?

The winter solstice (21 June) has come and gone. With the shortest day of the year now behind us, it's all up from here, but we've still got a while to go before we're back to the sunshine-filled days of summer. What do solar system owners need to know in the meantime? What happens to solar energy production in the winter?

Is winter solstice a good time for rooftop solar panels?

With winter solstice - the shortest day of the year - upon us, it's an appropriate time to bust another myth about rooftop solar panels. While today is still 24 hours long, the tilt of the Earth means the sun rises late and sets early.

Do solar energy systems work in winter?

One consideration for solar energy systems is the seasonal nature of the availability of light. Changes in the hours of darkness throughout the year and prevailing weather conditions act to limit the light levels in winter compared to summer, at least in locations that are away from the equator.

How much electricity does a solar panel produce in winter?

According to our calculations, solar panel output decreases by around 83% in the winter compared to the summer. To give an idea of what that means, a standard 3.5 kilowatt (kW) solar panel system will produce around 362-kilowatt hours (kWh) of electricity per month during the summer. In winter, that drops to 52 kWh.

Do solar panels produce more energy in winter or summer?

When we talk about factors that prominently impact the energy production of your solar panels, the solar panel output winter vs summer debate tops the list. It's not just about the longer days and stronger sunlight - it's a whole science thing. In the winter, solar panels can perform better on colder, sunnier days.

Why do solar panels generate less electricity in winter?

This is one reason why solar panels generate less electricity in winter - the days are just shorter. There also tend to be more cloudy days in winter, which can reduce the solar panels' output.
